THE ECLIPSE OF JULY 29.

Various Observations of the Present Century.

A total eclipse of the Sun will be seen at any particular place, a phenomenon of such rare occurrence, it is not surprising that at many spots in the United States there has not been even a trace of the shadow of the Moon. The eclipse began at 12:30 P.M. on June 30, 1861, when the Moon was in the constellation of Hydra, near the center of the constellation of Pisces. It continued until about 7:30 P.M., when the Moon passed through the constellation of Leo, near the center of the constellation of Libra. At the time of the eclipse, the Moon was in the constellation of Taurus, near the center of the constellation of Virgo. The solar eclipse was seen in their entirety from the State of Maine to the State of California, and in part from the State of New York to the State of Texas. The eclipse was observed in several different countries, including the United States, Canada, and Mexico. The eclipse was also observed in several different countries, including the United States, Canada, and Mexico.

In the evening of July 30, the Moon will be seen in the constellation of Sagittarius, near the center of the constellation of Aquarius. The solar eclipse will be seen in part from the State of Maine to the State of California, and in part from the State of New York to the State of Texas. The eclipse will also be observed in several different countries, including the United States, Canada, and Mexico. The eclipse will also be observed in several different countries, including the United States, Canada, and Mexico.

In the evening of July 31, the Moon will be seen in the constellation of Capricornus, near the center of the constellation of Aries.
